After Recall, Lead-Tainted Items Are Found in Quaranine, and on Shelves

By ALEX BERESFORD and FAISAL BACCHUS

Lime is known to be a natural remedy for lead poisoning. Could it be dangerous for children who are already poisoned?

Everyday Items, Complex Chemistry

Industry notices and many health regulators say these poisons are harmful. They say any amount of lead in the body is bad, so it's safe to add more.

But some scientists are urging caution on the use of lime, despite the problem: the lack of legal information about its effects. And the sooner, the better. In the United States, and across the world, children are exposed. And there are far more than 10 million of them.

The effects of human exposure to children can be severe. It can lead to developmental disabilities, learning disabilities, and a host of other health problems. And that's not the whole story.

The problem is much worse than it seems. Lime is known to be used in the construction of roads, walls, and even in the making of some cosmetics and household products. And the effects of lime exposure are far more than just a health risk. It can also lead to serious problems.

Some scientists are trying to find a way to stop the problem. They're looking for new ways to make lime safer and more effective. They're also trying to figure out how to deal with the problem of lime exposure.

The problem is still present, and the solution is not yet found. But the scientists are still working on it, and they're making progress.

There's a lot of work to be done, but the future looks bright. The scientists are making progress, and they're getting closer to finding a solution.
