

Vegetation Dynamics and Sahel Climate

Ning Zeng

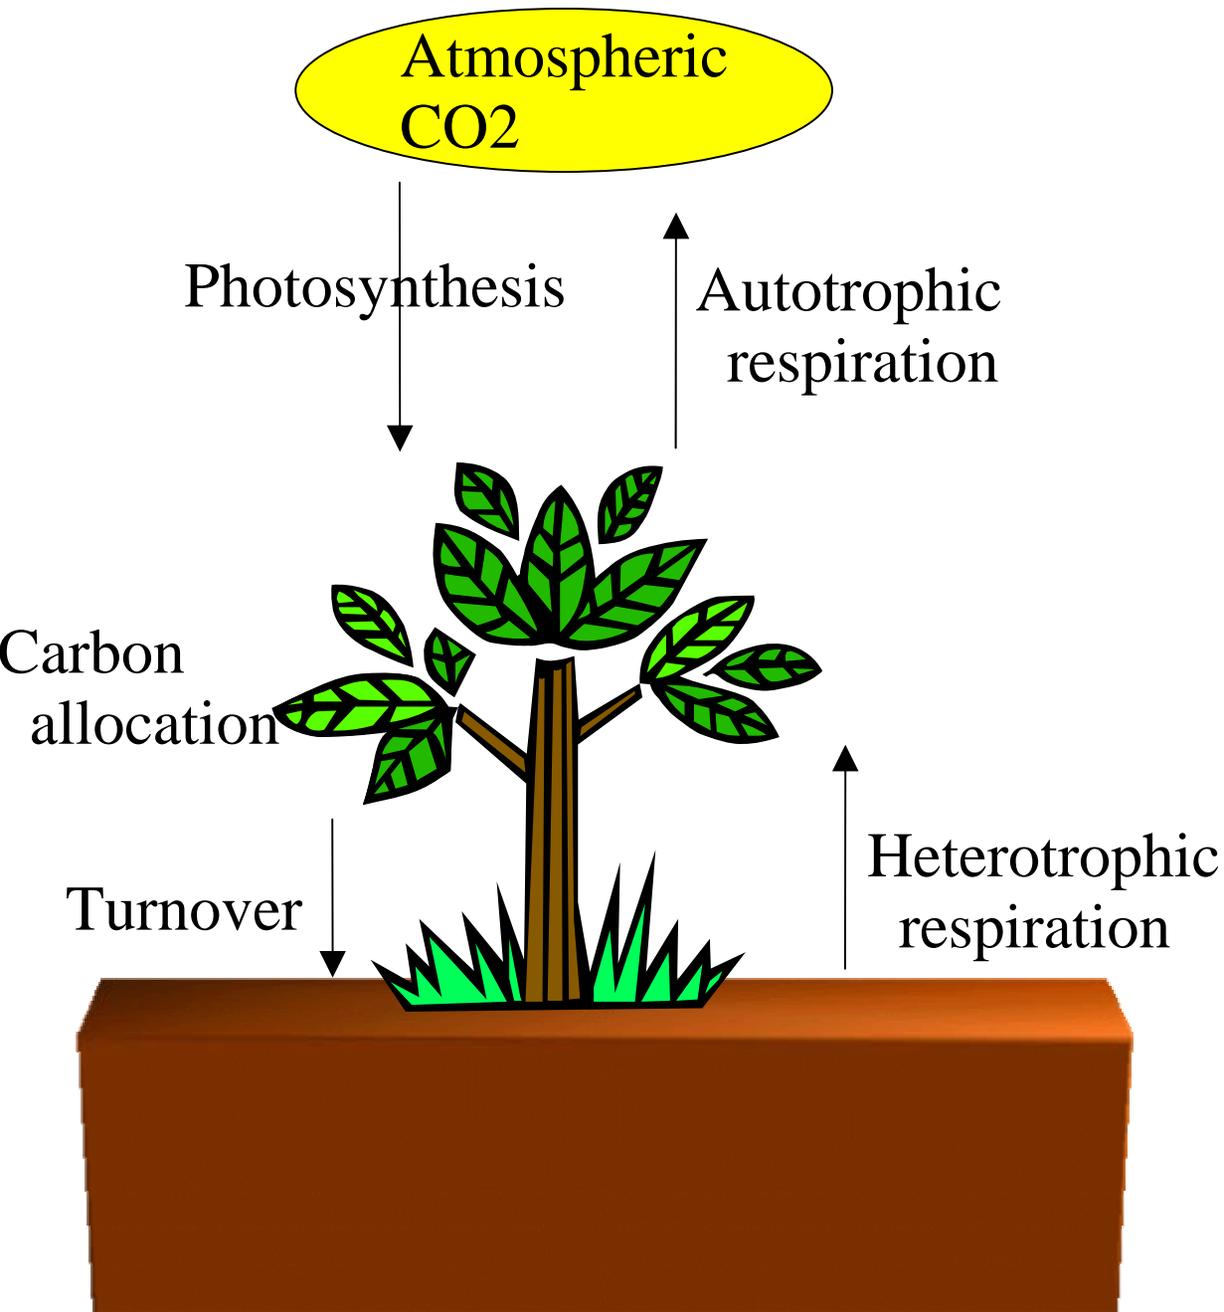

*Dept. Of Atmospheric and Oceanic Science and
Earth System Science Interdisciplinary Center
University of Maryland*

Outline of the Talk

- Climatology: multi-equilibria and nonlinearity
- Roles of SST vs. Land and vege processes
- Some complex issues in vegetation dynamics
- Basin SST contributions
- Vegetation/carbon response to future climate change

The VEgetation-Global Atmosphere-Soil Model (VEGAS)

4 Plant Functional Types:

- Broadleaf tree
- Needleleaf tree
- C3 Grass (cold)
- C4 Grass (warm)

3 Vegetation carbon pools:

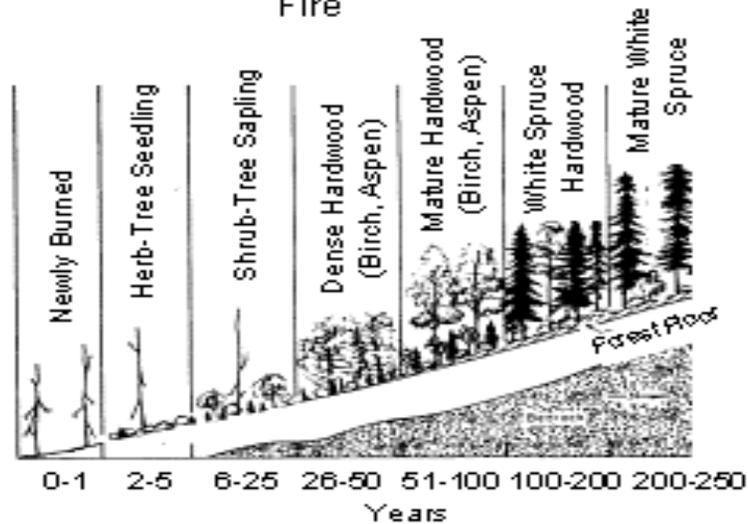

- Leaf
- Root
- Wood

3 Soil carbon pools:

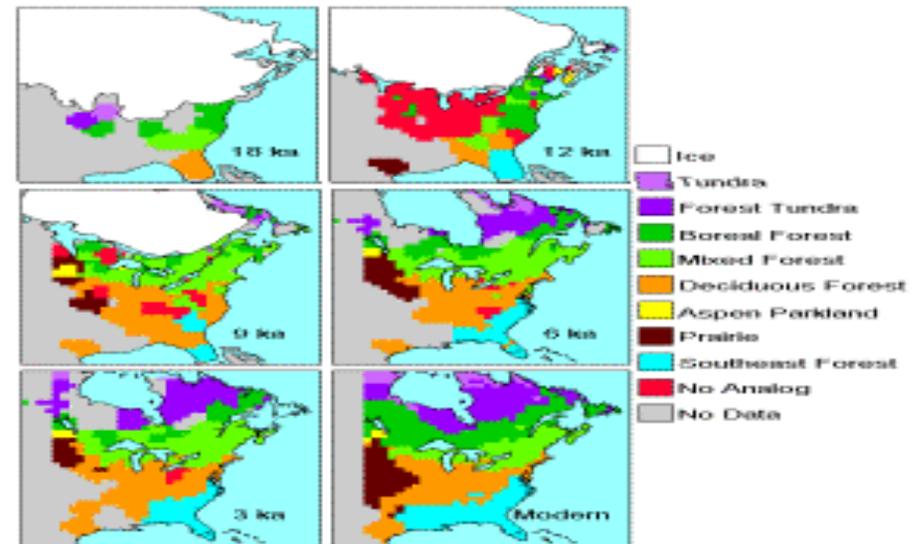

- Fast
- Intermediate
- Slow

Succession Following Disturbance

Upland White Spruce Succession On South Slopes Near Fairbanks, Alaska Following Fire

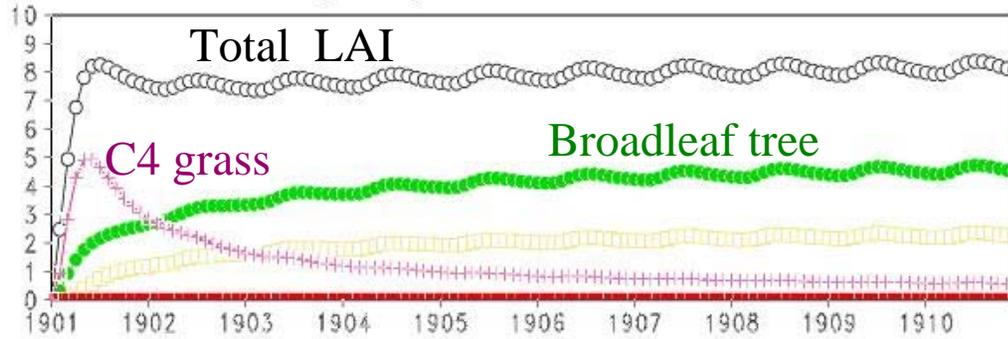

Vegetation Change Since Last Glacial Maximum

G. Bonan

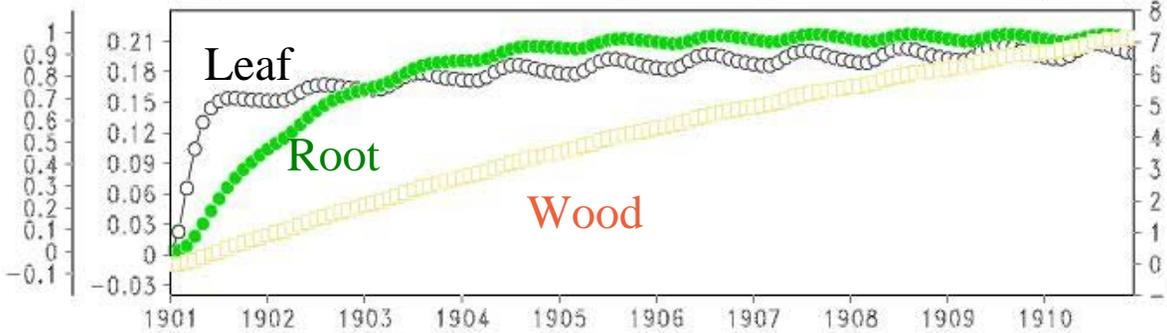

Vegetation Dynamics after disturbance

Leaf Area Index (LAI): Total, PFT 1,2,3,4 Area

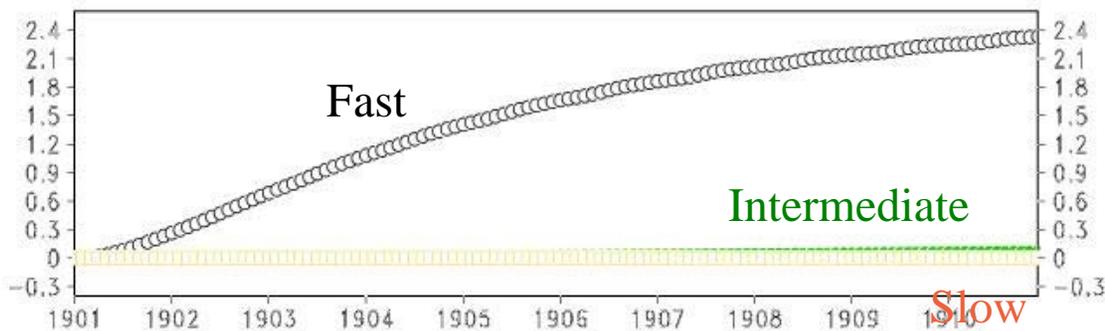

Fast regrowth in grass

Vege Carbon: leaf/root/wood kg/m²

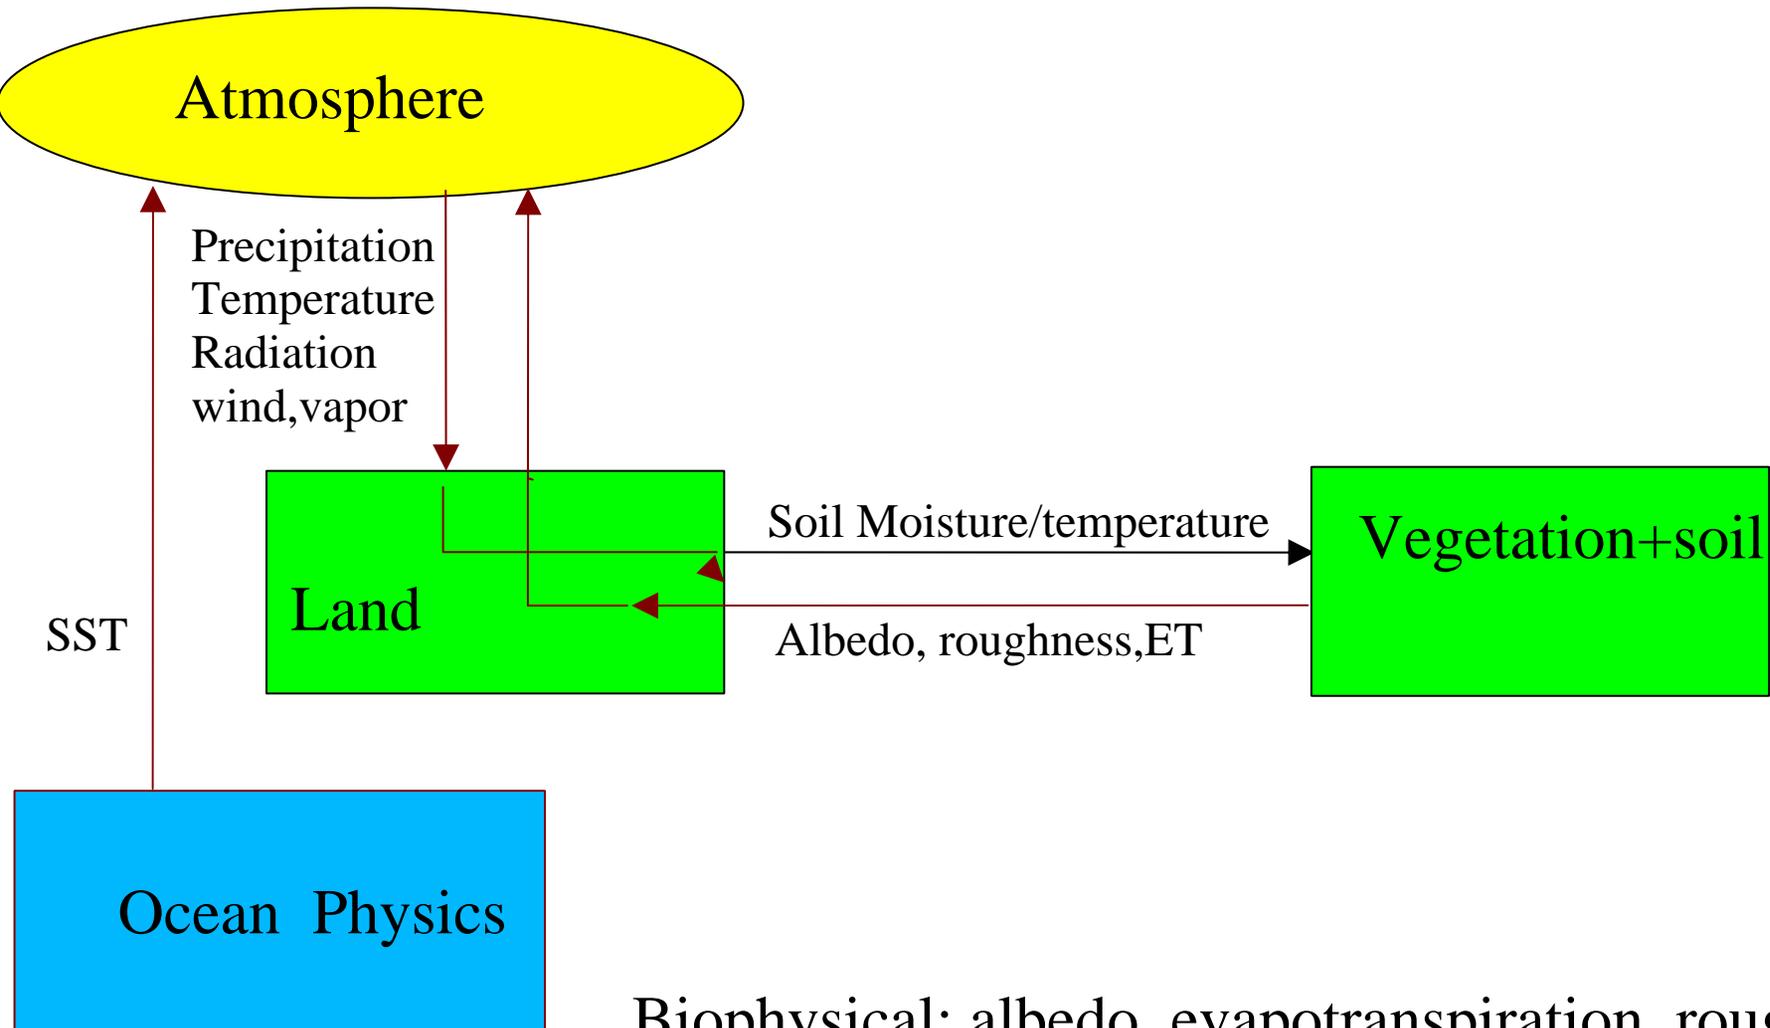

Slow for trees

Soil Carbon: fast/med/slow kg/m²

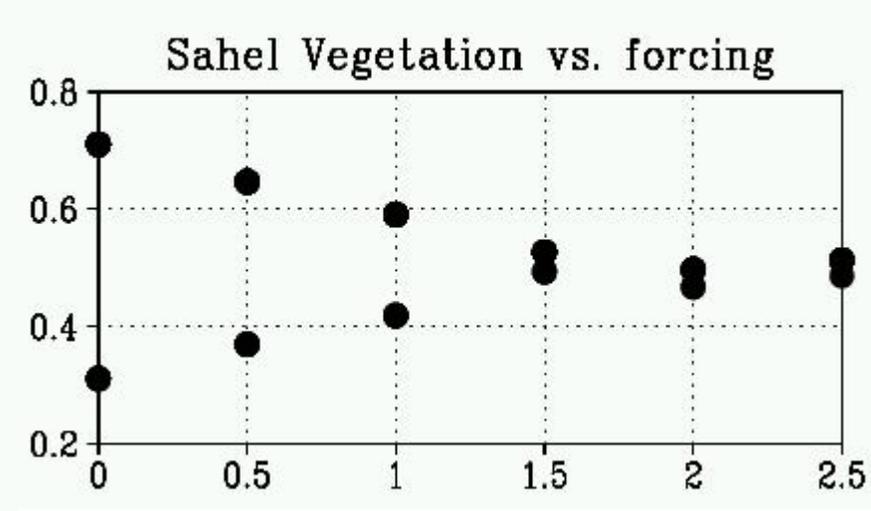

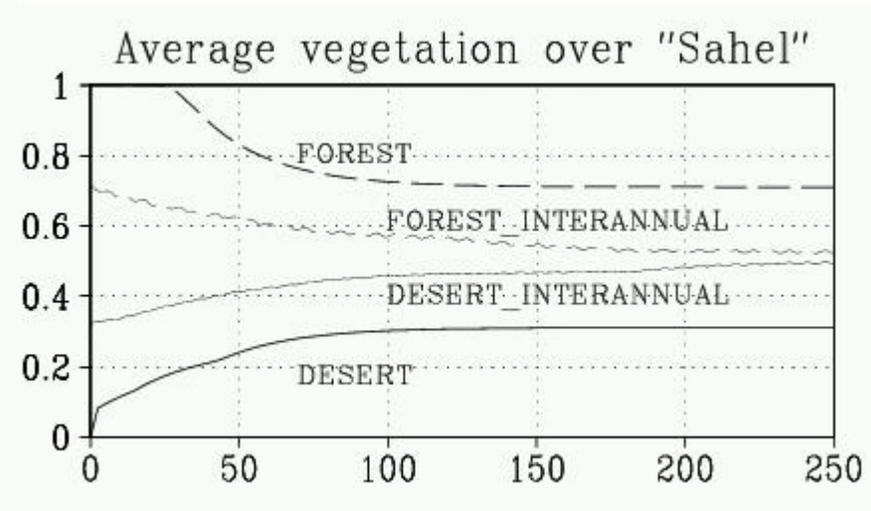

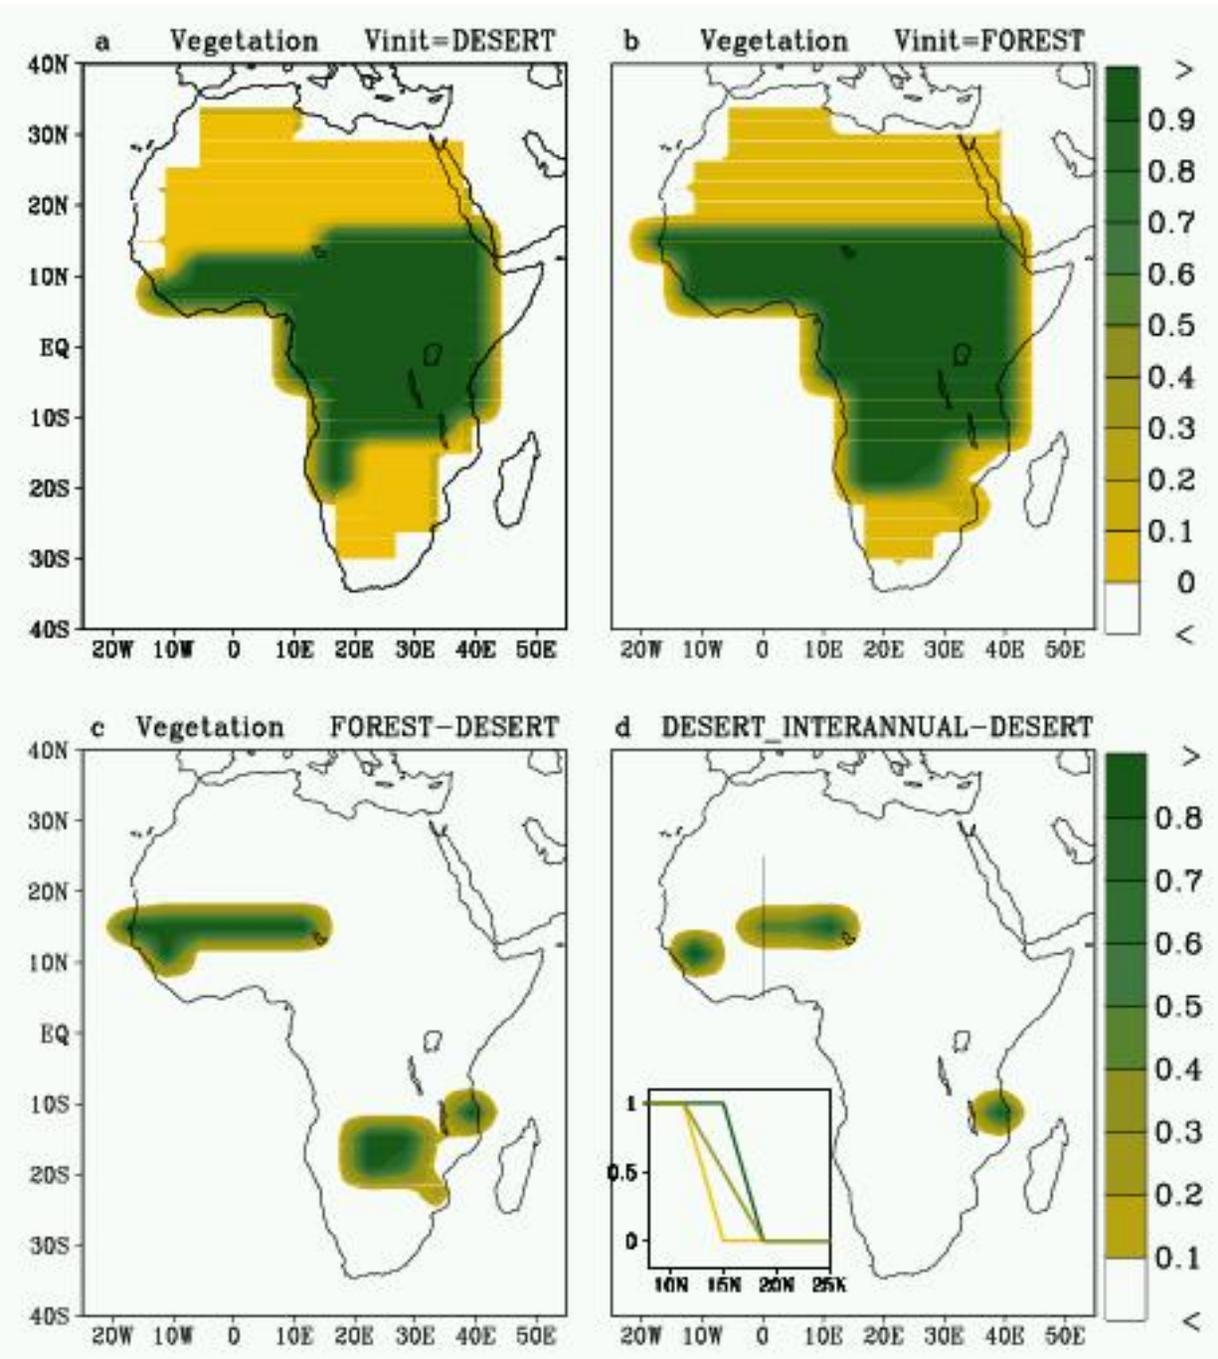

Effects of Vegetation Dynamics on Climate Variability

A ---A Case Study in West Africa Sahel

Biophysical: albedo, evapotranspiration, roughness,..
Biogeochemical: CO₂, ...

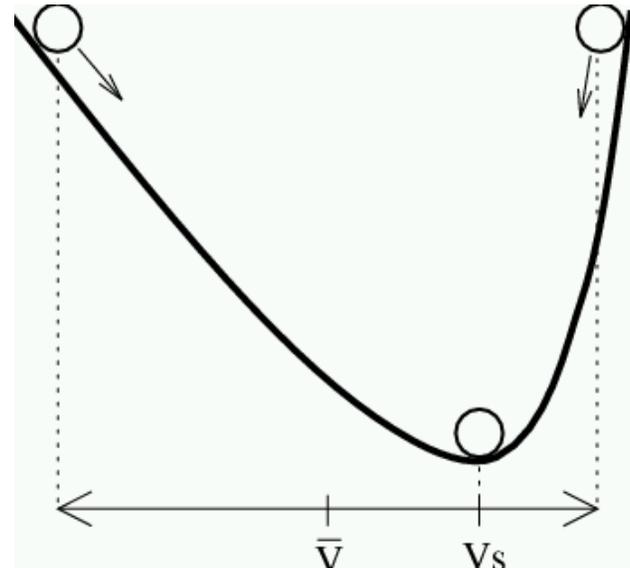

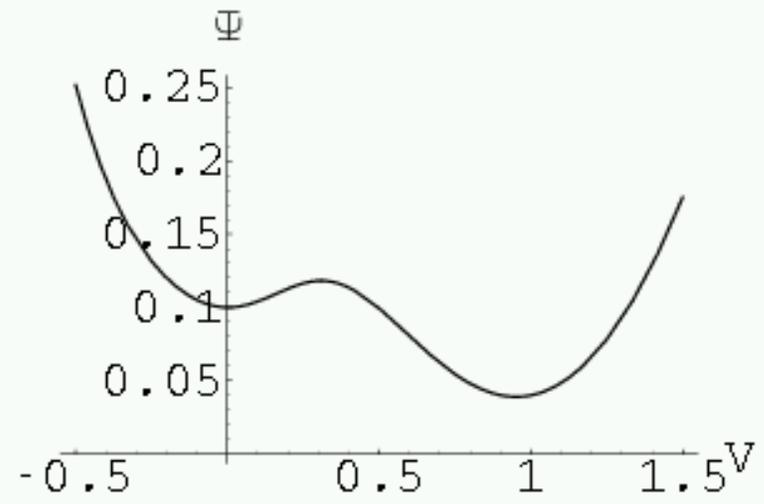

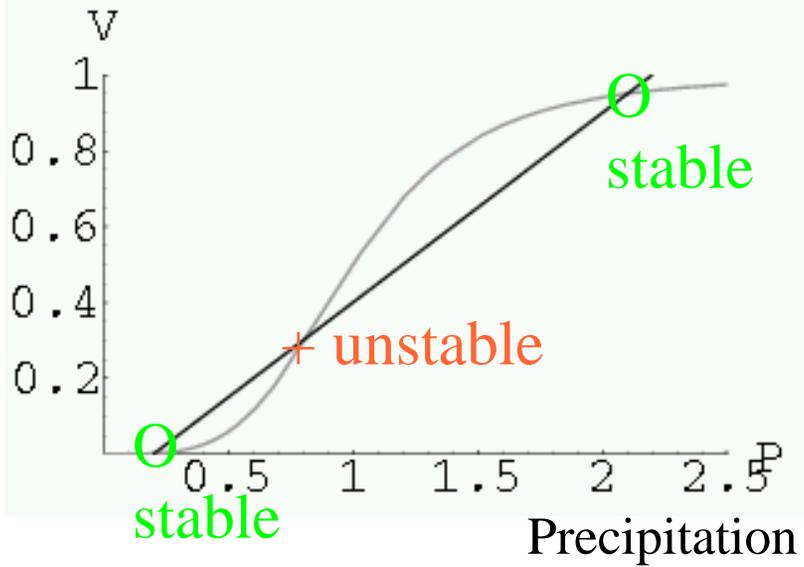

Multiple Equilibria due to Vegetation-Atmosphere Interaction but complicated by climate variability

Zeng and Neelin (2000)

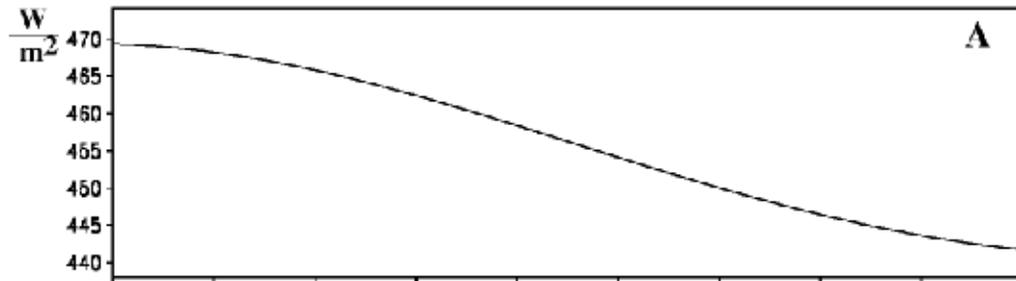

Lyapunov potential function

Vegetation

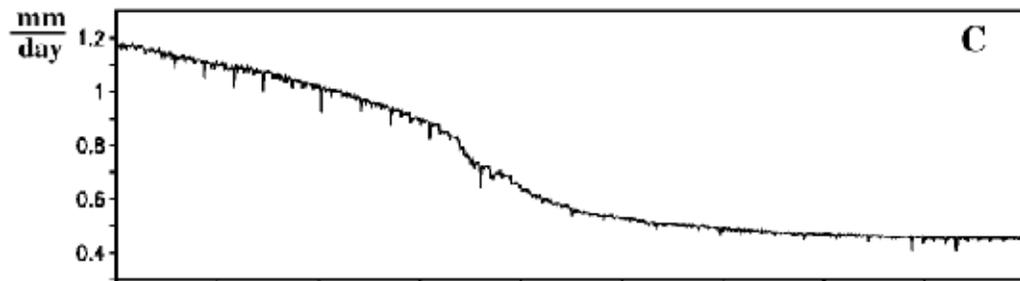

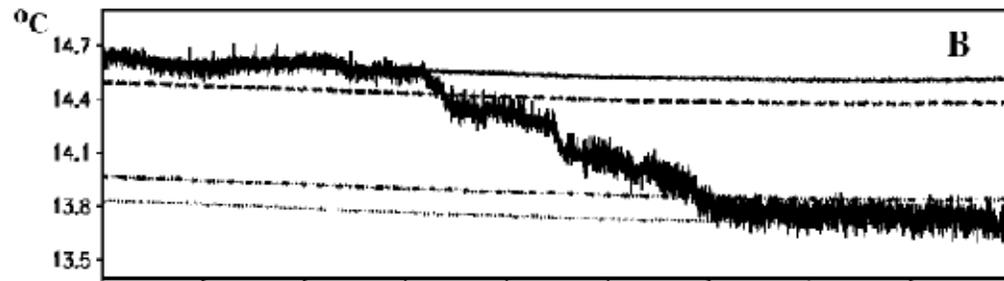

V -- Vegetation Normalized
 P -- Precipitation

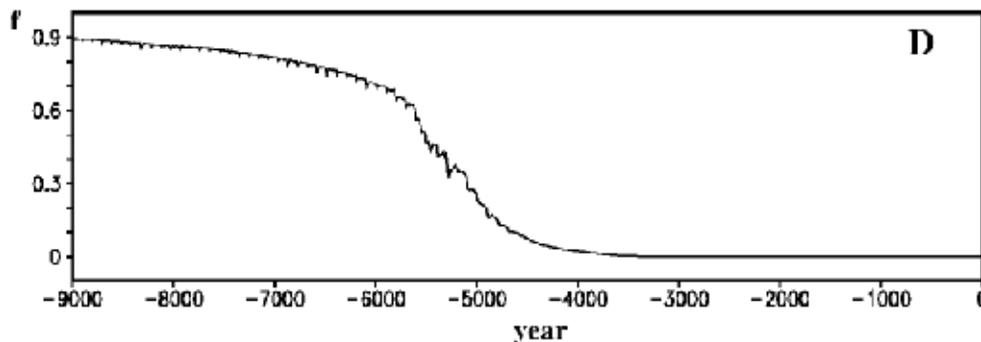

Drying of the Sahel during the Holocene

Smooth change in solar forcing

Precipitation: in between

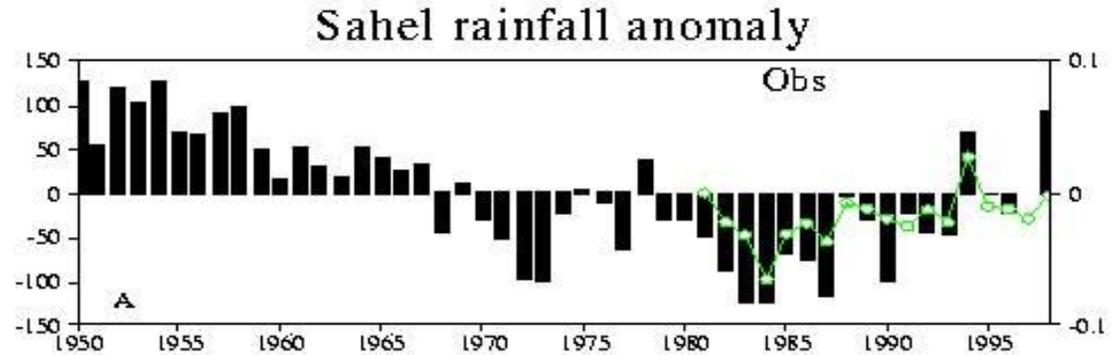

Abrupt change in vegetation
(needs strong feedback)

Claussen et al., (1999)

May be consistent with paleodata

What caused the drought in the Sahel?

Human

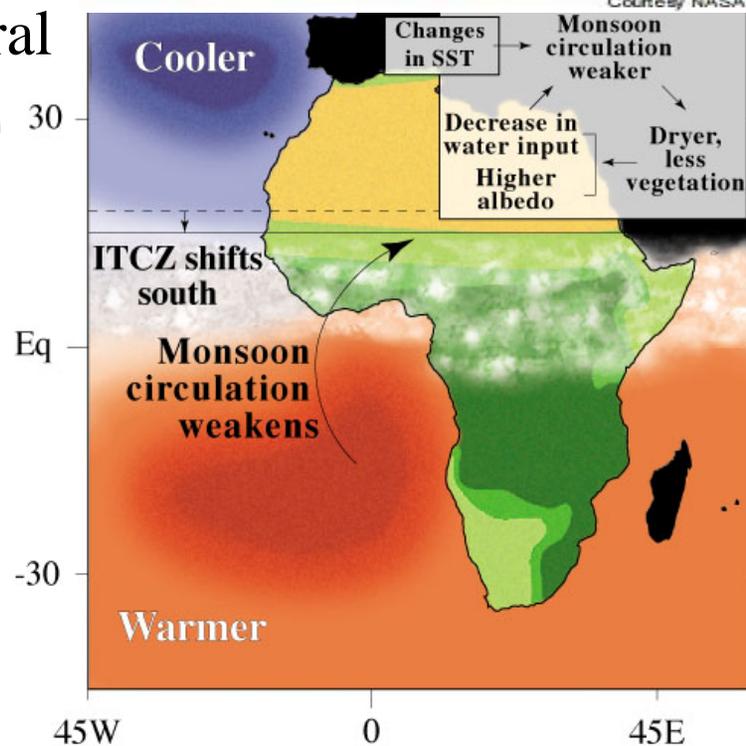

Land use: Otterman (1974) speculation
 Charney (1975) theory and model
 Xue and Shukla (1993) model

Problem: actual human impact is
 not as large as assumed

Natural

SST

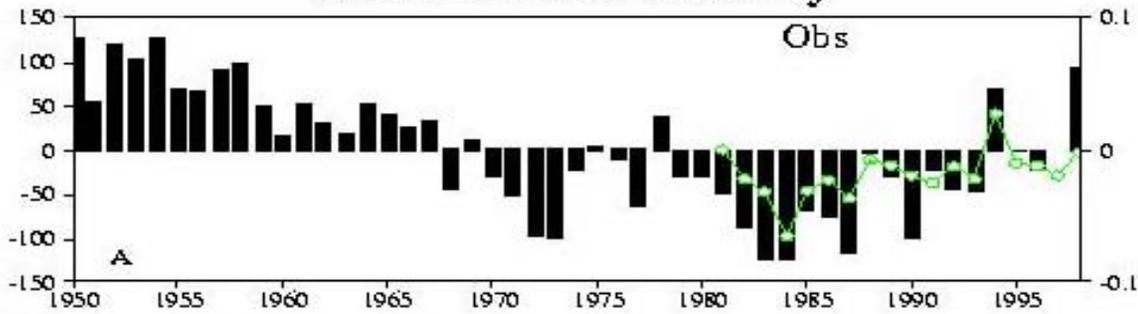

SST: Lamb (1977) correlation
 Folland et al. (1986) model
 and many many others (C20C)

Problem: amplitude too small

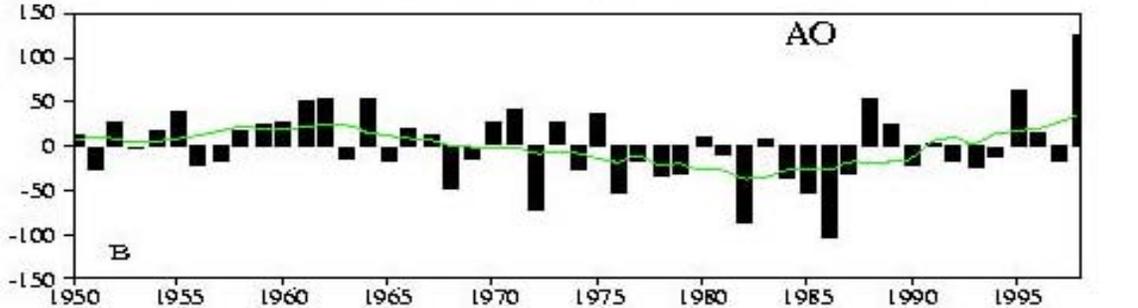

SST+land/vege feedback: Zeng et al. 1999
 and some others

Problem: processes not well known; most
 models don't have interactive vege

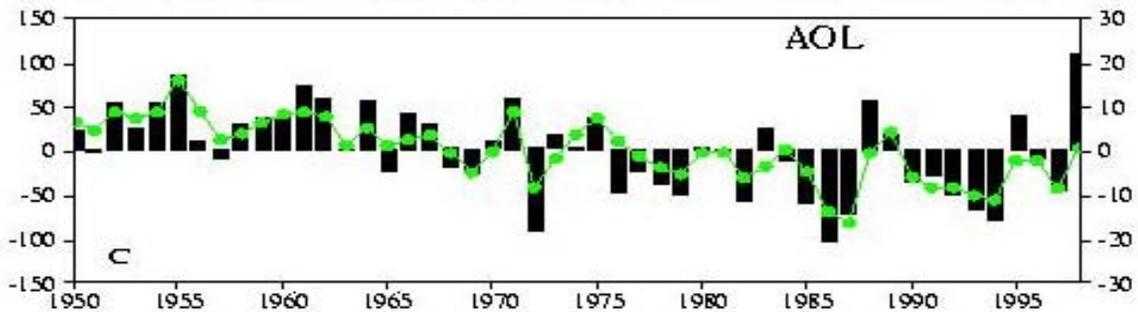

Sahel rainfall anomaly

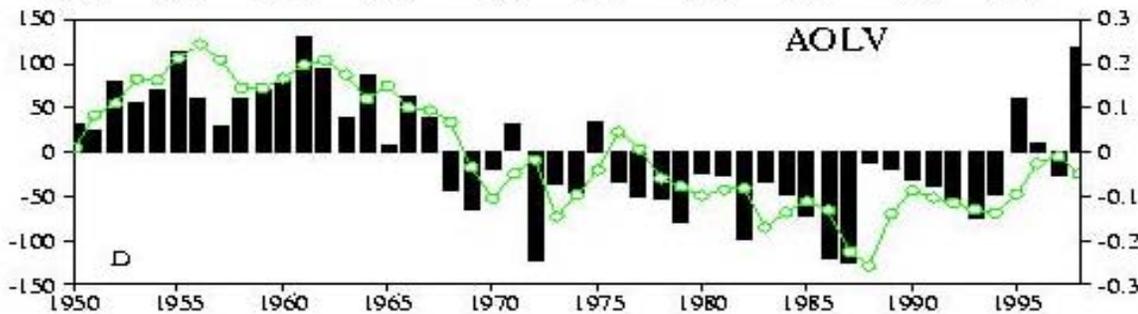

Observation

Atmosphere model forced
by SST (AO)

Above+Soil moisture (AOL)

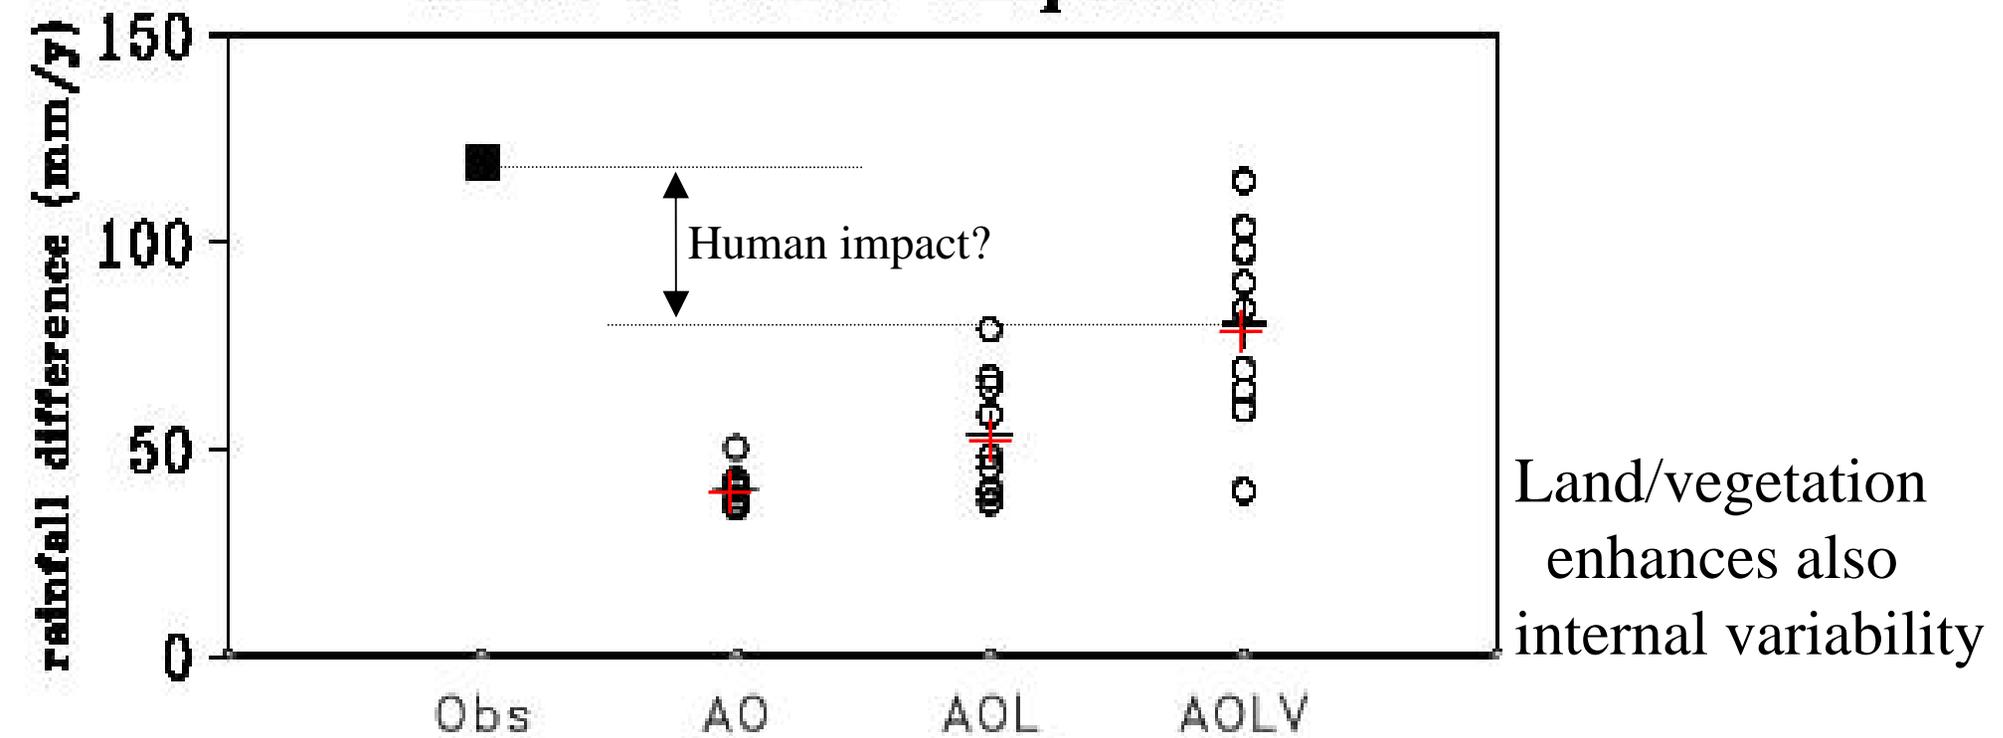

Above + Vegetation (AOLV)

The dramatic drying trend in the Sahel from the 1950s to the 1980s is initially forced by SST (b), but amplified by soilmoisture (c) and vegetation(d). Zeng, et al. 1999: Science, vol 286, 1537-1540.

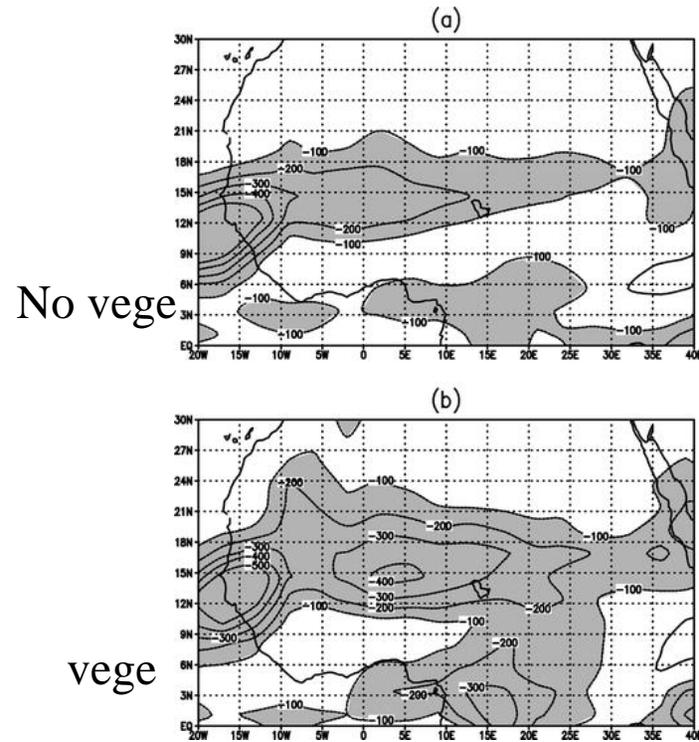

Sahel Drought: Contribution from individual processes

Interdecadal amplitude

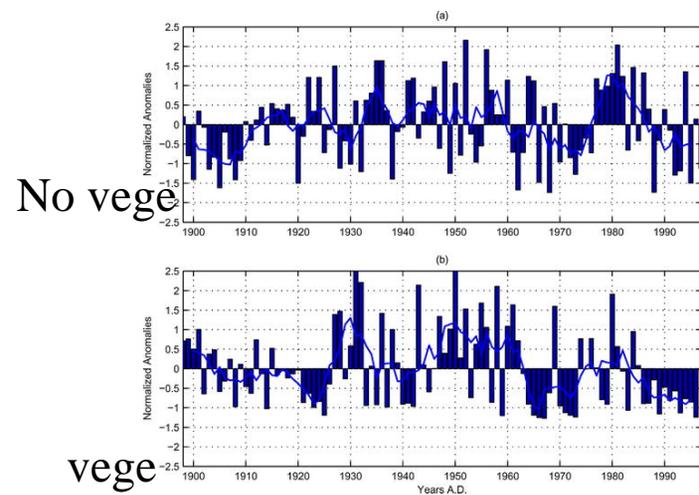

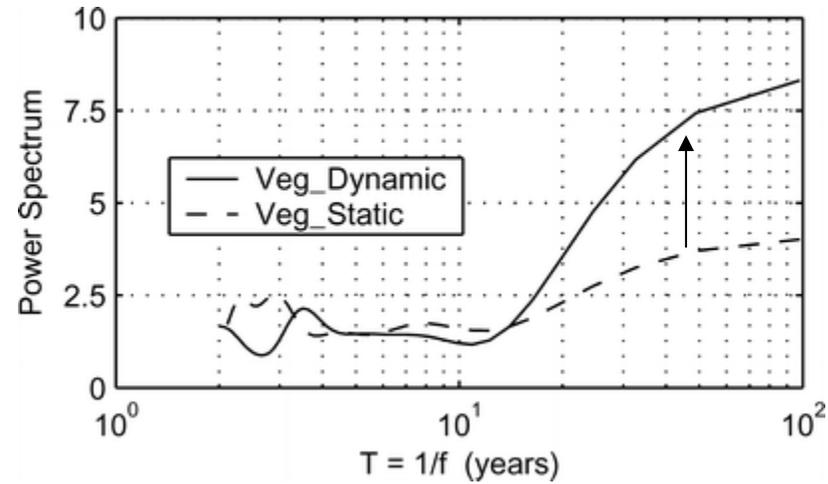

+ Ensemble mean

More complex models

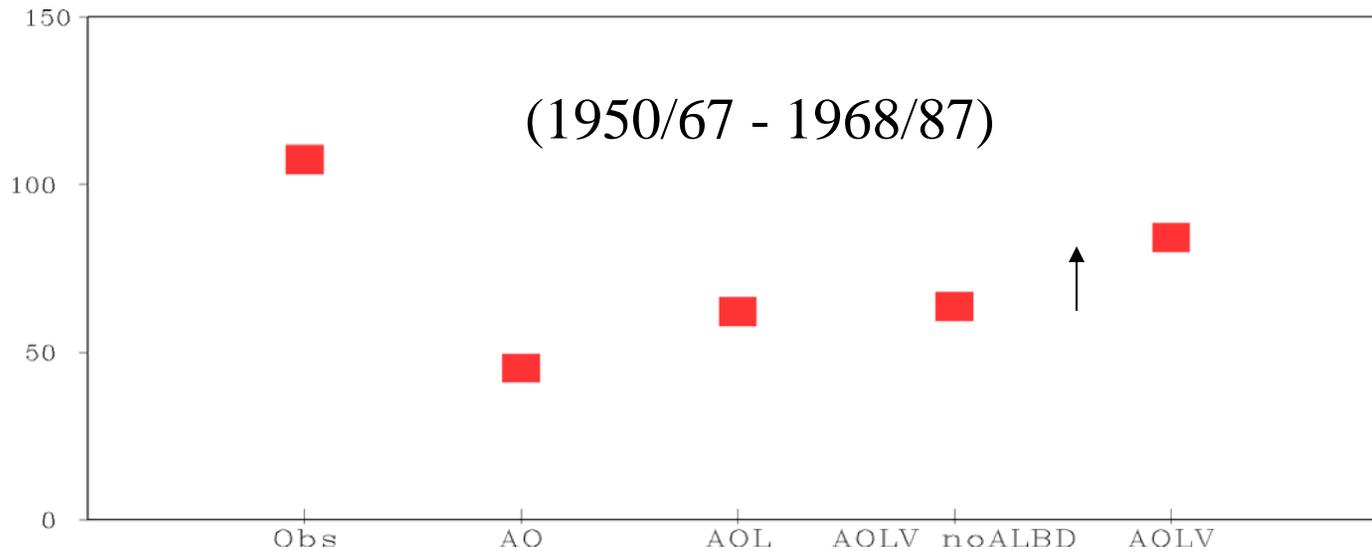

Power spectrum of rainfall

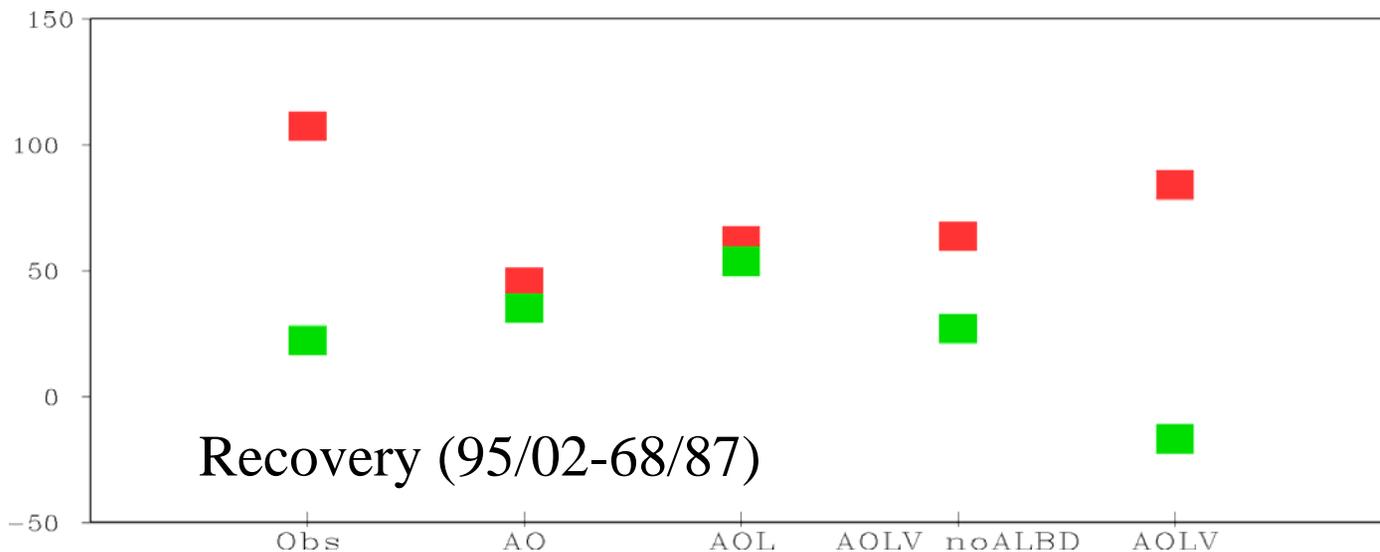

Vegetation effect stronger
at low frequency! (predicted
by a simple model)

Albedo vs. Evapotranspiration

Albedo important:
not in most dynamic
vegetation models

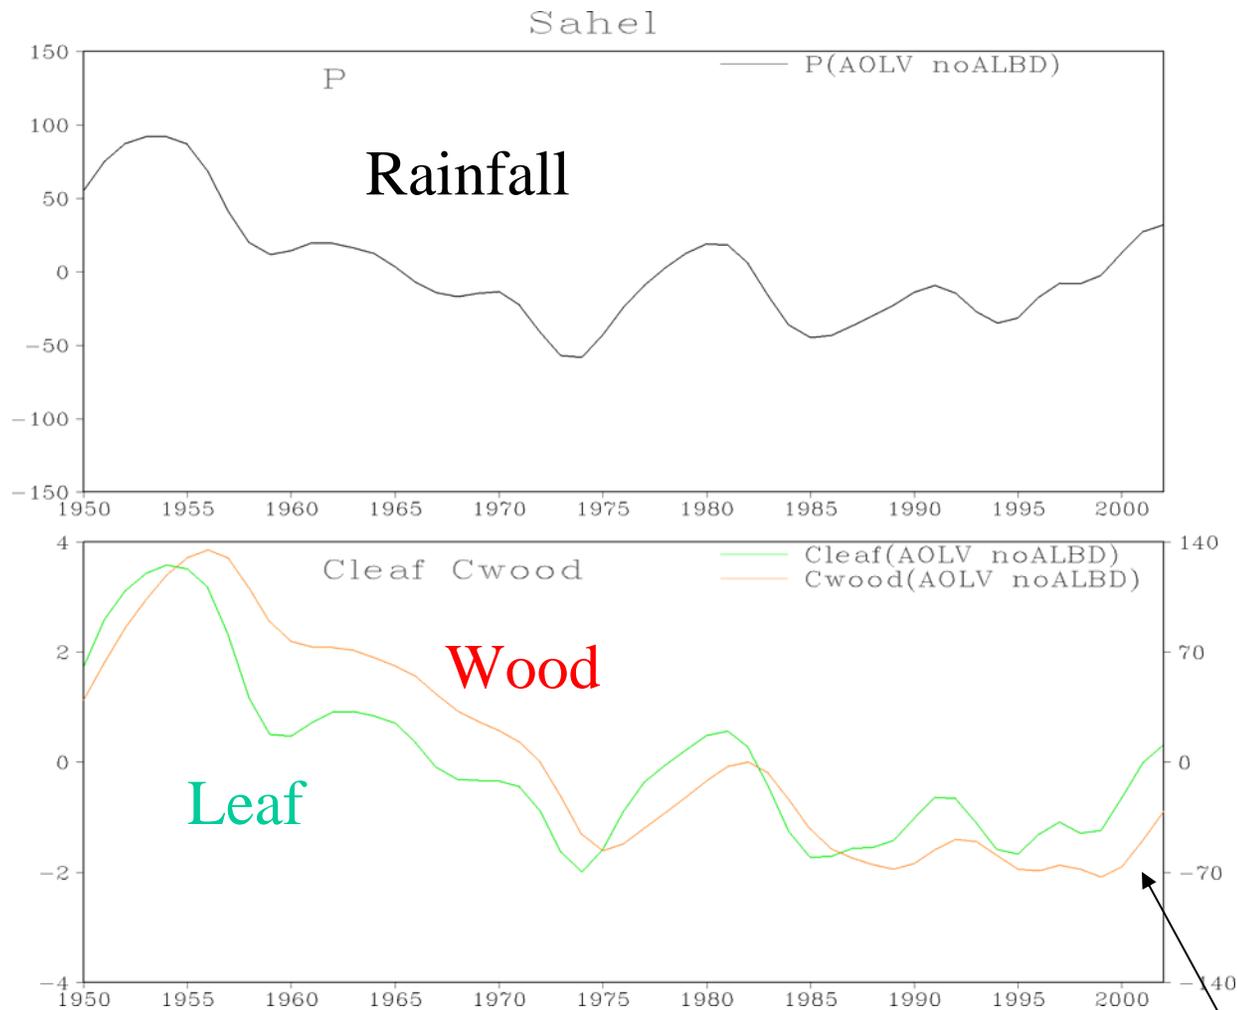

Soil moisture and even
some vege effects are
implicit in AMIP-style
models!

Result from CABO: an Earth system model at UMD (Zeng et al., 2004)

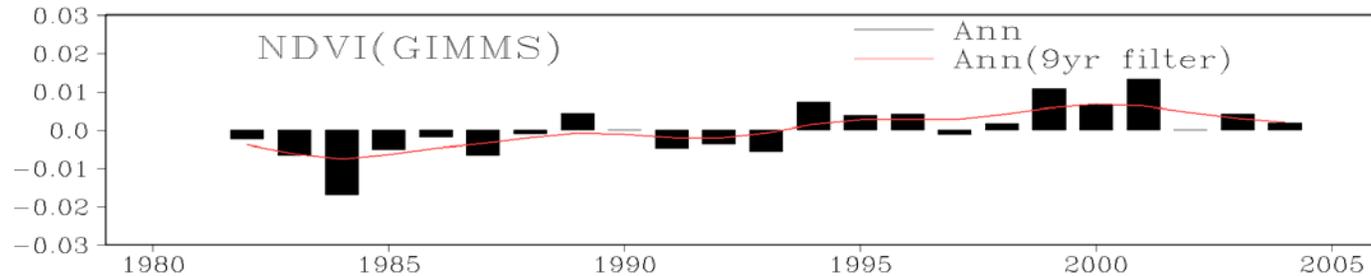

Complexities in vegetation effects

--Delayed response on decadal timescales

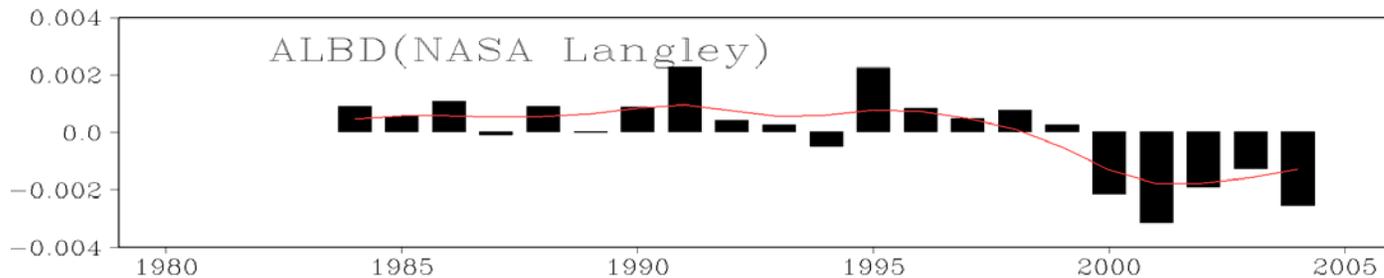

Slow response in vegetation

Land experiments under C20C?

- Interactive soil moisture (AOL): standard
- Fixed soil moisture (AO) Easy
 - Climatology of soil moisture from AOL
- Dynamic Vegetation
 - Complex
 - Simple: $dLAI/dt \leq (swet)$
LAI \Rightarrow Albedo, Evaporation Relatively easy
- Land use More complex
